WHAT IS DRIVE?

Drive is a lens design specifically developed for driving. It also features a dedicated zone for night driving.

Due to reduced light levels, the pupil dilates, which may lead to night myopia. Studies have shown that, in low-light conditions, the eye naturally focuses at an intermediate distance.
Because of the eye position while driving, the upper part of the lens is the area through which the wearer looks most frequently.

Night Driving Visual Zone

For presbyopic wearers, we recommend Adaptive Drive progressive
